## 1 Summary

GENE-SWiTCH aims at identifying functional elements located in the genomes of pig and chicken working on seven different tissues at three different developmental stages. It requires a collection of samples corresponding to the selected tissues and developmental stages with associated metadata describing accurately the samples and the sampling process.

The seven tissues analysed in GENE-SWiTCH are:

- Cerebellum
- Lung
- Kidney
- Dorsal skin
- Small intestine
- Liver
- Skeletal muscle

The three developmental stages are:

- Early organogenesis (E8 chick embryo and D30 pig foetuses)
- Late organogenesis (E15 chick embryo and D70 pig foetuses)
- Newborn piglets and hatched chicks

To increase the quantity of available material for Iso-seq, we decided to pool total RNAs for each tissue at a defined developmental stage. We finally produced 21 pools, for each of the 7 tissues at the 3 different stages of development.

## 2 Protocol description

Working on ice, total RNAs extracted from each sample were pooled according to the following table:

|           | Liver  | Small intestine  | Lungs  | Hindlimb muscle  | Kidney   | Cerebellum   | Back skin  |
|-----------|--|--|--|--|--|--|--|

The Biosamples IDs (<https://www.ebi.ac.uk/biosamples/>) correspond to the metadata of the samples used in each pool.

Samples are finally stored into a cryotube storage box at -80°C.
